*Cover photo:* Twenty-eight-year-old male for whom MRI was performed to differentiate between Crohn's disease and ulcerative colitis. Coronal true FISP fs shows optimal distended terminal ileum (arrow), without bowel wall thickening. No small bowel pathology was detected elsewhere. This patient was diagnosed with ulcerative colitis in follow-up. From "Magnetic resonance imaging of the small bowel with the true FISP sequence: intra- and interobserver agreement of enteroclysis and imaging without contrast material" by Bart M. Wiarda, Karin Horsthuis, Annette C. Dobben, Remy W.F. Geenen, Martin A. Heitbrink, Willem Moolenaar, Ernst J. Kuipers, Jaap Stoker on pages 267–273 in this issue.
